Product Overview

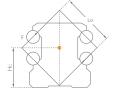

ARC/HRC/ERC Product Characteristics

Our standard **CPC** ARC/HRC/ERC Linear Guide Series uses the O-type arrangement for its four-row ball circulation design. The 45-degree contact angle between the rails and balls allows our product to realize a four-directional equivalent load effect. **CPC** has placed special emphasis on strengthening the arm length (Lo) of our product so that when sustaining external force (F), this can have an even higher Mr value, which increases its rigidity and torsion-resistant capabilities. The larger and more numberous balls in our products allows it to have a 10-30% greater load capacity than similarly sized competitor products. These and other characteristics are the source of our product's high load capacity, moment, and stiffness features.

Unit:mm

Mode Code	Lo	Нс
15	12.4	9.35
20	16.4	12.5
25	19.5	14.5
30	24.0	17
35	30.4	19.5
45	38.2	24
55	43.1	28.5

F = Mr/Lo(Lx)

O-Type Arrangement

X-Type Arrangement

Inner Lubrication storage Pad (Upper)

- No need to increase the length of the runner block
- Full lubrication contact with balls, particularly suitable for short stroke movement.

End Cap

All-around lubrication holes system

High abrasion resistant

material end seal

 Standard contactless, low friction, high dust proof seal

- Inner Lubrication storage Pad (Bottom)

Ball chain

- Patented design to enable reverse operations.
- Muted and prolonged service life
- High Load and torque capabilities
- Excellent dynamic performance: Reach V max 10 m/s Reach amax 450 m/s²
- Can provide counterbored holes from the top and tapped mounting holes from the bottom rail
- Can provide specialized steel surface treatment

■ Increased X-axis axial force capacity

(Standard)

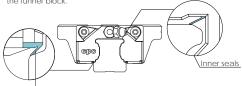

Dustproof design

Inner Seals

The newly designed inner seals both protect the rails from foreign particles and keep the lubrication inside the runner block, while maintaining a low friction profile.

Bottom Seals

The bottom seals work in conjuction with the inner seals to keep foreign particles out and lubriation from leaking out. Our comprehensive sealing design significantly reduces re-lubrication needs and prolongs service life of the runner block.

Bottom Seals

End Seals

The end deals work in conjuction with the bottom and inner seals to block foreign particles out and prevent lubrication leakage. Our engineering plastic has a strong friction resistance and is less prone to cracking than typical NBR plastics.

Standard Seals (S)

Our standard seals are in direct contact with the rail surface, giving them increased dustproof and lubcrication retenion capabilities. CPC recommends this class of seal for blocks that operate in environments high in foreign particles, such as sawdust, for long periods of time. S-type seals will have a compratively higher friction then B-Type seals.

Low Friction Seals (B)

Our low-friction seals have slight contact with the rail and are suitable for most environments, with both low friction and a scraper function.

Seal type friction comparison

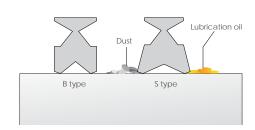

Friction levels will be the highest on new linear rails. But, after short periods of operation, such friction will be reduced to a constant level.

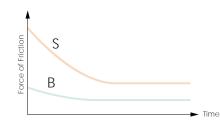

Stainless Steel Reinforcement Plate

The reinforcement plate also functions as a scraper for larger particulates like iron fillings, and has no more than 0.3mm clearance between the plate and the rail.

Average Friction of Block

Below are the tables for the block body and end seal friction levels under greaseless conditions.

Unit: N

	ARC/HRC/ERC											
Block Type	Friction	n caused f	rom ball b	earing		End Seals	(2 sides)

(Standard)

Saw wood dust Test

Test content

This test uses a total of 4 groups of products (2 rails matched with 2 lubrication methods) which are put on a saw wood dust surface on which a back and forth motion test is performed.

Rail

- 1. Tapped from top rail plus hole plugs (AR)
- 2. Tapped from bottom rail (ARU)

Runner Block

- 1. Installation of standard contact type seals (S), using grease
- 2. Installation of lubrication storage Pad and standard contact type seals(SZ), using grease

Testing conditions

- 1. Stroke = 600mm
- 2. Total testing stroke = 30m

- Test items
- 1. If saw wood dust enters the inner surface of the runner block
- 2. If saw wood dust enters the ball bearing runner area

Test results

Tapped from bottom (oil) Tapped from bottom (grease)

Checked Item Installation status	If saw wood dust enters inner block surface	If saw wood dust enters ball bearing runner area
ARU Rail SZ Type Runner Block (oil lubrication)	No	No
ARU Rail S Type Runner Block (grease lubrication)	No	No
AR Rail SZ Type Runner Block (oil lubrication)	Yes (belly area)	No
AR Rail S Type Runner Block (grease lubrication)	Yes (belly area)	No

Test result

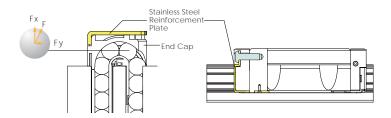

- The tapped from top rail has hole plugs, leading to rail unevenness, allowing some saw wood dust to enter the runner block belly area. The 2 sides of the runner block belly area are completely protected by stainless steel reinforcement plates and end seals, meaning that the ball bearing runner area is fully shielded from saw wood dust.
- The tapped from bottom rail has an even rail surface so that the ball bearing runner area is fully protected from saw wood dust.

Stainless steel reinforcement plate (Patent)

Scraping function on both sides

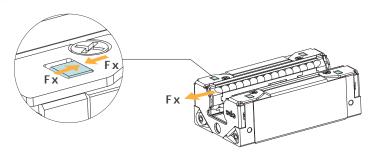

Using 2 stainless steel reinforcement plates, the L type design allows for screws to be fastened onto the top and bottom of the runner block, reinforcing the rigidity and cladding of its caps.

The clearance between the rail profile with the seal design is below 0.3mm, reinforcing the steel plates while enabling scraper functions.

Function of high speed operation

Our ARC/HRC/ERC type features stainless steel reinforcement plates and additional bottom latches, increasing its axial force and tolerance capacity to achieve faster operation speeds.

Mutli-Directional Lubrication Nozzles (All-direction Lubrication Nozzles)

Our product features lubrication ports on the top, bottom, and sides, allowing installation of optional grease nipples for relubrication. The top port comes with a O-ring seal to allow easy re-lucrication from the top, and our diverse comphrensive lubrication injection design allows for lubrication in both axis.

(Option)

Low noise, superior quality high speed ball chain (Patent) Ordering code: C

With traditional ball type linear guides, the spinning of balls in different directions leads to a two times faster contact speed. Such high friction greatly reduce the service life of such products. Additionally, the contact point between such balls also produces high pressure and noise levels while increasing the danger of oil film cladding damage.

Low noise ball chain The contact point between the balls and ball chain leads to a low

Traditional Ball type linear guide

surface pressure level.

Because the contact point of ball type linear guides is only between balls, the surface pressure is significantly higher.

- The CPC ball chain provides a greater contact area between the balls and the ball chain. Because the film cladding will not be damaged easily and due to the lower noise volume, balls can move at a higher speed while product service life can also be extended significantly.
- * The size of the ball chain design block is the same as that of linear guides without ball chains, allowing for same dimensions and use of identical guides.

Heavy load test

Condition Model : ARC25MN SZC V1H Velocity : 1m/sec Load capacities : 7.44kN(0.3C)

Dynamic load rating C₁₀₀ : 24.8kN Stroke : 960mm Preload : 0.05C

Rating Life($\frac{C}{P}$) 3 x 100km=($\frac{C}{0.05C+0.3C}$) 3 x 100km=2332km

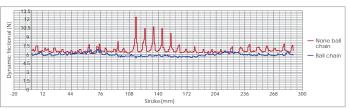

After testing, grease remains without anomalies

Smoothness test

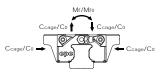

Model code : ARC25MNSV1N Velocity : 10 mm/sec

Load capacity of ball chain

There are three advantages of ARC/HRC/ERC ball chain series as compared with traditional, non-ball chain blocks:

- 1. The space block in the ball chain can prevent the oil film from rupturing by ball to ball contact and decrease friction induced wear.
- 2. The retainer block of the ball chain can maintain a reliable oil film layer by continuously applying grease on the moving part.
- 3. The ball chain provides the important function of leading steel ball motion. For traditional blocks without ball chains, its steel balls are pushed by the rotating back steel balls on the raceway, meaning that the contact angle between the balls and rail is less precise, causing vibration and an increased stress level between balls. In comparison, the balls in our ball chain product are led by the ball chain to ensure a correct fit and accurate contact angles. In this way, our product's ball chain design ensures that it can fit correctly when entering the raceway and that the contact angle will be accurate. This means that our Ball chain design provides for a smooth performance, lower vibration levels and less additional stress levels.

Dynamic	rating	load

The table on the right shows the C_{cage} and C_{so} values via different machine type testing. (According to ISO-14728 regulations)

Model Code		C _{ISO} (kN)	C _{cage} (kN)

(option)

Lubrication Design (Ordering Code: Z) (ARC/HRC)

Inner oil storage and oil supply system design

Our Inner PU Lubrication Storage Pad design does not increase the length of the runner block and can effectively lubricate all balls. Customers can inject lubrication oil directly through its lubrication holes to ensure a sufficient storage in the PU Lubrication storage pad. This not only enables long term lubrication effects, but also a higher degree of ease at conforming to environment protection needs and lowering maintenance costs. For short stroke movements, this product allows for highly effective lubrication.

Upper Lubrication Storage Pad

Bottom Lubrication Storage Pad

External NBR Seal with Metal Scraper (Ordering Code: SN) (ARC/HRC/ARR/HRR/LRR)

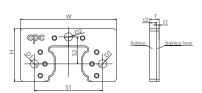

Available for applications in harsh environments such as in grinding, glass processing, graphite processing and wood-working machinery, providing a highly effective dust and iron scrap proofing solution

Installation Manual

- When installing the external NBR seal, please ensure that the block is on the rail
- 2. Ensure that the rubber part is fitted in the sleeve. If the rubber part has fallen off, set the sleeve to the corresponding bore.
- 3. Overlap the rubber part and metal scrapper with the corresponding salient point and bore. The CPC logo must be facing outward.
- 4. Slide the external NBR seal into the rail from two sides and closely connect with the block.
- 5. Fasten the screw into the correspondence bore and align the seal with the center of the rail and properly fastened. Do not allow the metal scraper to make contact with the guide rail.

Metal-Plastic-Cap Patent Design for Standard Rail-Bolt-Hole (With patent)

(Ordering Code: MPC)

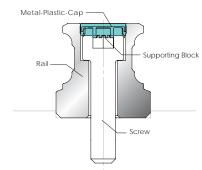

Metal Cap Features Introduction

The Most Convenient Metal Cap Used in Industry

- The upper part of the cap is made of stainless steel which can prevent sharp foreign objects from piling up on the bolt-hole and affect the end seal function.
- The lower part of the cap is made of plastic, and can be installed directly on a standard rail without the need for additional bolt-hole slot milling.
- The bolt-hole chamfer for standard rails is C0.2mm. For further dustproof requests, the non-bolt-hole chamfer rail is optional upon ordering. (order code: TR)

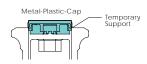

Cap can be Smoothly Installed on Bolt-Hole

Bolt-hole cap of conventional linear guides, due to the difficulty of controlling hammering strength, often result in caps being hammered too deep or surface unevenness which leads to the accumulation of dirt or scrap iron. Our **CPC** cap is especially designed with a supporting block to prop up the cap and to fix the screw stably, thus preventing such unnecessary sinking.

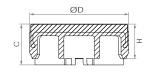

Cap before Hammering (Plastic Support)

Plastic Support after Hammering (The form of the 8 supporting blocks will become altered to fit with the screw)

Installation Notice

Dimension of reference edge

To ensure that the linear guide is precisely assembled with the machine table, **CPC** devices have a recess installed in the reference edge corner. The corner of the machine table must be smaller than the chamfer of the linear guide to avoid interference. To consult on chamfer sizes and shoulder heights, please refer to the table below.

Rail Joint

The standard length of our large rails is 4 meters. If longer rails are required, **CPC** can provide a joint rail solution for which the joint number will be marked on the rail.

- 1. As shown in figure A, please follow the joint number to assemble.
- 2. For more than two units in each axis, to avoid accuracy effects from multiple blocks passing through the same connection point, we advise to use the connection points separately as shown on figure B.
- 3. Please use the slide as a connection point to tighten the slide before tightening the torques to fasten the screws from inside to outside.

NRB: nickel coating treatment on the

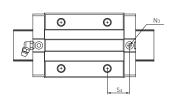

- : black chrome coating treatment BRB: black chrome coating treatment SB: with stainless steel ball bearings
- CR: clear chrome coating treatment on CB: clear chrome coating treatment on CRB: clear chrome coating treatment on the block and rail NR: nickel coating treatment on the rail

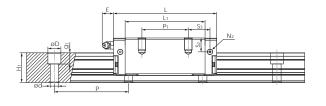

- SG: installation of side grease holes and set screws
- PC: with plastic caps for counter holes on the rail
- MPC: with Metal-Plastic Caps for rail mounting holes.
- TR : bolt-Hole without chamfer
- RR: raydent coating treatment on
- RB: raydent coating treatment on
- RRB: raydent coating treatment on the block and rail
- NB: nickel coating treatment on the block

Note: If there is a need for further customization or other special requirements, please contact cpc for more information.

^{1.} The load capacities is for full-ball type (without ball chain)

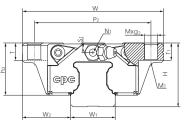

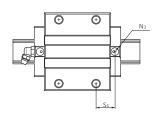

^{3.} N₃ = O-ring size for lubrication from above

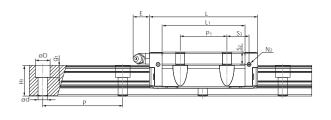

^{2.} N₂ = Injecting holes

^{4.} N₂ ,N₃ will be sealed before shipmant, please open it when first using the product.

Product Overview

AR/HR/ER Lightweight Linear Guide Product Characteristics

The CPC lightweight Ball Type Linear Guide Series adopts a unique O-type arrangement and four row ball circulation design, featuring high load capacities and stiffness. The contact angle between the rail and the ball is 45 degrees and enables an equal load capacity in all 4 directions.

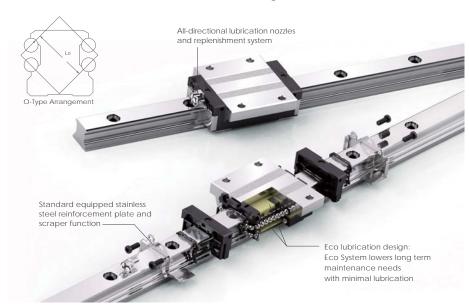

Among the AR/HR/ER Lightweight Linear Guides, two of the four circulation channels are positioned within the plastic accessories, reducing the block weight by $10 \sim 20\%$.

Our Stainless steel reinforcement plate has scraper functions while our L design fastens the screws onto the top and bottom of the runner block, reinforcing the rigidity of both the end caps and cladding; thereby further enabling the high speed movement of products. Our AR/HR/ER Lightweight Linear Guide also provides preload classes of VC and V0 etc.

This is to enhance the dimension tolerance and to further satisfy the convenience for our customers processed component requirements and to further reduce the cost for such manufacturing work.

- High velocity tolerance
- Four directional load capacity.
- Utilizing the same rail as ARC/HRC/ERC

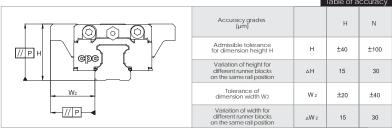

- Lightweight steel block reflow hole design
- Processed accessories match dimension tolerance
- vertical (downward) and reverse (upward) bolting track rails available.

- Available for special surface treatment
- Excellent dynamic performance: Reach Vmax > 5m/s Reach amax > 300m/s²
- Dust protection of double wipe blade design in the end seal; equipped as either standard or extra reinforcement type

Technical information

Accuracy

For parallel datum plane motion accuracy of runner block in contrast to the linear guide, please refer to P13

The above rating load capacities and static moments are calculated according to the ISO14728 standard. The rating life for basic dynamic load ratings is defined as the total 100km travel distance for 90% of a group of identical linear guides under the same conditions and free from any material damage caused by rolling fatigue. If a standard of 50km travel distance is applied to measure the average product lifespan, the above basic dynamic load rating C should be multiplied by 1.26 for an accurate conversion.

The dynamic load rating value with ball chain Ccage is the measured value (please refer to page 08). The above static load rating and the static moment are calculated according to the ISO 14728 standard.

Product Overview

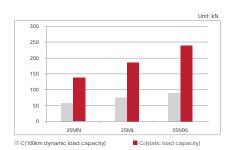

LRR Extremely Low Profile Type

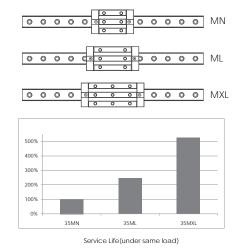

Suitable for conditions where a lower external torque and inertial force is required, this product combines a low height and center of gravity to provide a more compact product. ARR, HRR and LRRs blocks all share the same rail with a similar load capacity and service life.

MXL Ultra Long Block Type

Compared to the industry's ML lengthened block, the MXL model's much lengthened block features a greater load, rigidity and shock reduction capability. This makes this model most suitable for machine tools that require super high rigidity and accuracy.

Parts information

Low Noise Roller Chain (Optional)

Our Ball chain design effectively lowers high frequency noise volumes while sliding and enhancing smoothness.

Additionally, the ball chain spacer between steel rollers continuously replenishes the oil film cladding to maintain a better lubrication

(For more information please refer to page 07)

Full Cover Seal (Standard Feature)

All model type are equipped with an "end seal", "bottom seal", and "inner seal" to effectively prevent foreign objects from sliding into the block or lubrication from leaking out.

(For more information please refer to page 03)

High Rigidity Stainless Steel Reinforcement Plate (Standard Feature)

Our L-shaped design is locked with end and bottom screws on the block body. The bottom of the body is equipped with an integrated bolt, which allows for the tight fixing of the reinforcement plate to prevent unnecessary block damage from cracking the plastic mountings.

(For more information please refer to page 06)

Metal-Plastic-Cap (Standard Feature)

Stainless steel covers can demonstrate excellent friction resistance under harsh environments. Inside, the hole plug is equipped with fixed plastic support, enabling for easy installation and direct installation on a standard rail. Contact between the unit support part and stigma screws can prevent overly deep fastening during installation, while also preventing cap indentation and foreign objects from stacking while sliding.

(For more information please refer to page 10)

NBR Seal (Optional)

The seal demonstrates a high dustproof ability to be used in high dust particle working environments, being ideally placed in wood-working machines, glass processing machines, graphite processing machines and grinders. On the outer side of the seal is equipped a stainless steel scraper, with the clearance between the inner and rail contour measuring at only 0.2-0.3mm. This can prevent comparatively large foreign objects from damaging the rubber seal.

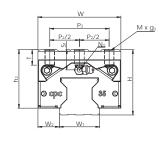

(For more information please refer to page 09)

Nipple Option

Grease nipple/ Oil piping joint

- The L type nipple is for both ball bearing and roller type external seals (SN)
- The XL type nipple is for the roller type external seal (SN)

Note: in case of need for customization or special requirements, please contact cpc

Lubrication Kit and Grease Gun

The **CPC** Lubrication Unit is a supply nozzle with 3 different sizes of nozzle adaptors. These nozzle adaptors are suitable for differently sized grease nipples on different sized linear blocks.

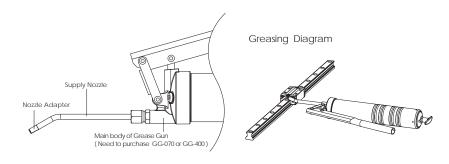

Nipple Option

			Nipp	le Size	Nipple Type
	Type		Section	Side	Standard
ARC15	HRC15	-	M3	M3	A-M3
ARC20	HRC20	-	M3	M3	B-M3

ARC45	HRC45	-	PT1/8	M6	B-PT1/8
ARC55	HRC55	-	M6	M6	B-M6

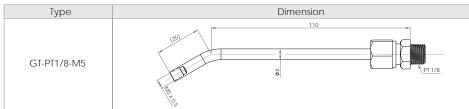

GP-PT1/8-01 Lubrication Kit

The Lubrication Kit comes equipped with a supply nozzle (GT-1/8-M5) and three kinds of different nozzle adaptors (GH-M5-MR, GH-M5-06, GH-M5-08).

The supply nozzle can be mounted on the main body of the common manual or pneumatic grease gun with PT1/8 tapped connectors widely available on the market.

CPC AR/HR Z Series Lubrication Storage Pad Testing Report

A linear guide is a category of rolling guidance systems. By using unlimited recirculating stainless steel balls that operate between the raceways of the rail and the runner block, the carriage achieves high precision and low friction linear movement. If the linear guides do not have sufficient lubrication, rolling friction will increase, causing wear and shortened linear guide lifespan

cpc has added and embedded PU lubricant storage pads to prolong the life of the linear guide; the pads directly contact and lubricate the rolling balls. This design supplies sufficient lubrication even in short stroke operations.

cpc's design, due to the embedded pads absorption and retention capabilities, results in a product that features a long operation life and long-term lubrication.

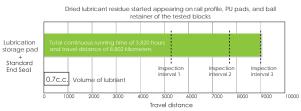

Following are the results of cpc's in-house testing.

AR15 Lubrication Storage Pad Testing Data

Tested products: AR15 blocks with lubrication storage pads, 8 pieces, and AR15 rails, N accuracy grade, 1500mm Length, 4 pieces

Testing condition	
Rating load capacities(each Block)	1.8KN(C=9KN · C0=17.5KN)
Stroke	0.96m
Max running speed	1m/s
Lubricant	DAPHNE SUPER MULTI 68 (Viscosity64.32 CST 40OC)
Lubrication period	No lubrication added during testing period

Testing result

■ Testing equipment

■ Test results at inspection intervals Inspection intervals 1 and 2 Inspection interval 3

No wear on rail profile

Some rail profiles have dried

Inspection intervals 1 and 2: Lubrication Maintained

- · Upward lubrication storage
- pads in good condition Lubricant supply in good
- No wear on the running profile of the rail.

· Lubricant supply in good condition.

Dried Jubricant residue and breakage on the upward lubrication storage pads

Inspection interval 3: Lubricant residue

Dried lubricant residue and breakage on the downwa lubrication storage pads.

Plastic parts and end seal in good condition

End seal in good condition

Test Summary

Total continuous running time of 3820 hours and travel distance of 8802 kilometers.

Out of eight test blocks, dried lubricant residue appeared on 2 blocks and 1 rail.

Dried lubricant residue is indicative of a need for relubrication and thus lengthens the operational life of the linear guide.
